

LAP JOINT FLANGE

Easily removable pipe connection flange

Description

A Lap Joint Flange is a specialized type of flange designed for easy assembly and disassembly in piping systems. It consists of two main components: a stub end and a loose backing flange. The stub end is welded to the pipe, while the backing flange is bolted to the stub end, allowing for smooth alignment and flexibility during installation. This design is particularly advantageous in applications that require frequent maintenance, as it provides a reliable seal while simplifying the installation and removal processes. With its ease of use, the lap joint flange is ideal for systems where accessibility and adaptability are essential.
